

Outpacing the Competition: A Systems Engineering Challenge

18 April 2018

Presented To:

Phoenix Integration Users Conference

Presented By:

Dave Cohen, Director , AIR 4.1 Systems Engineering Department

Competition is Back

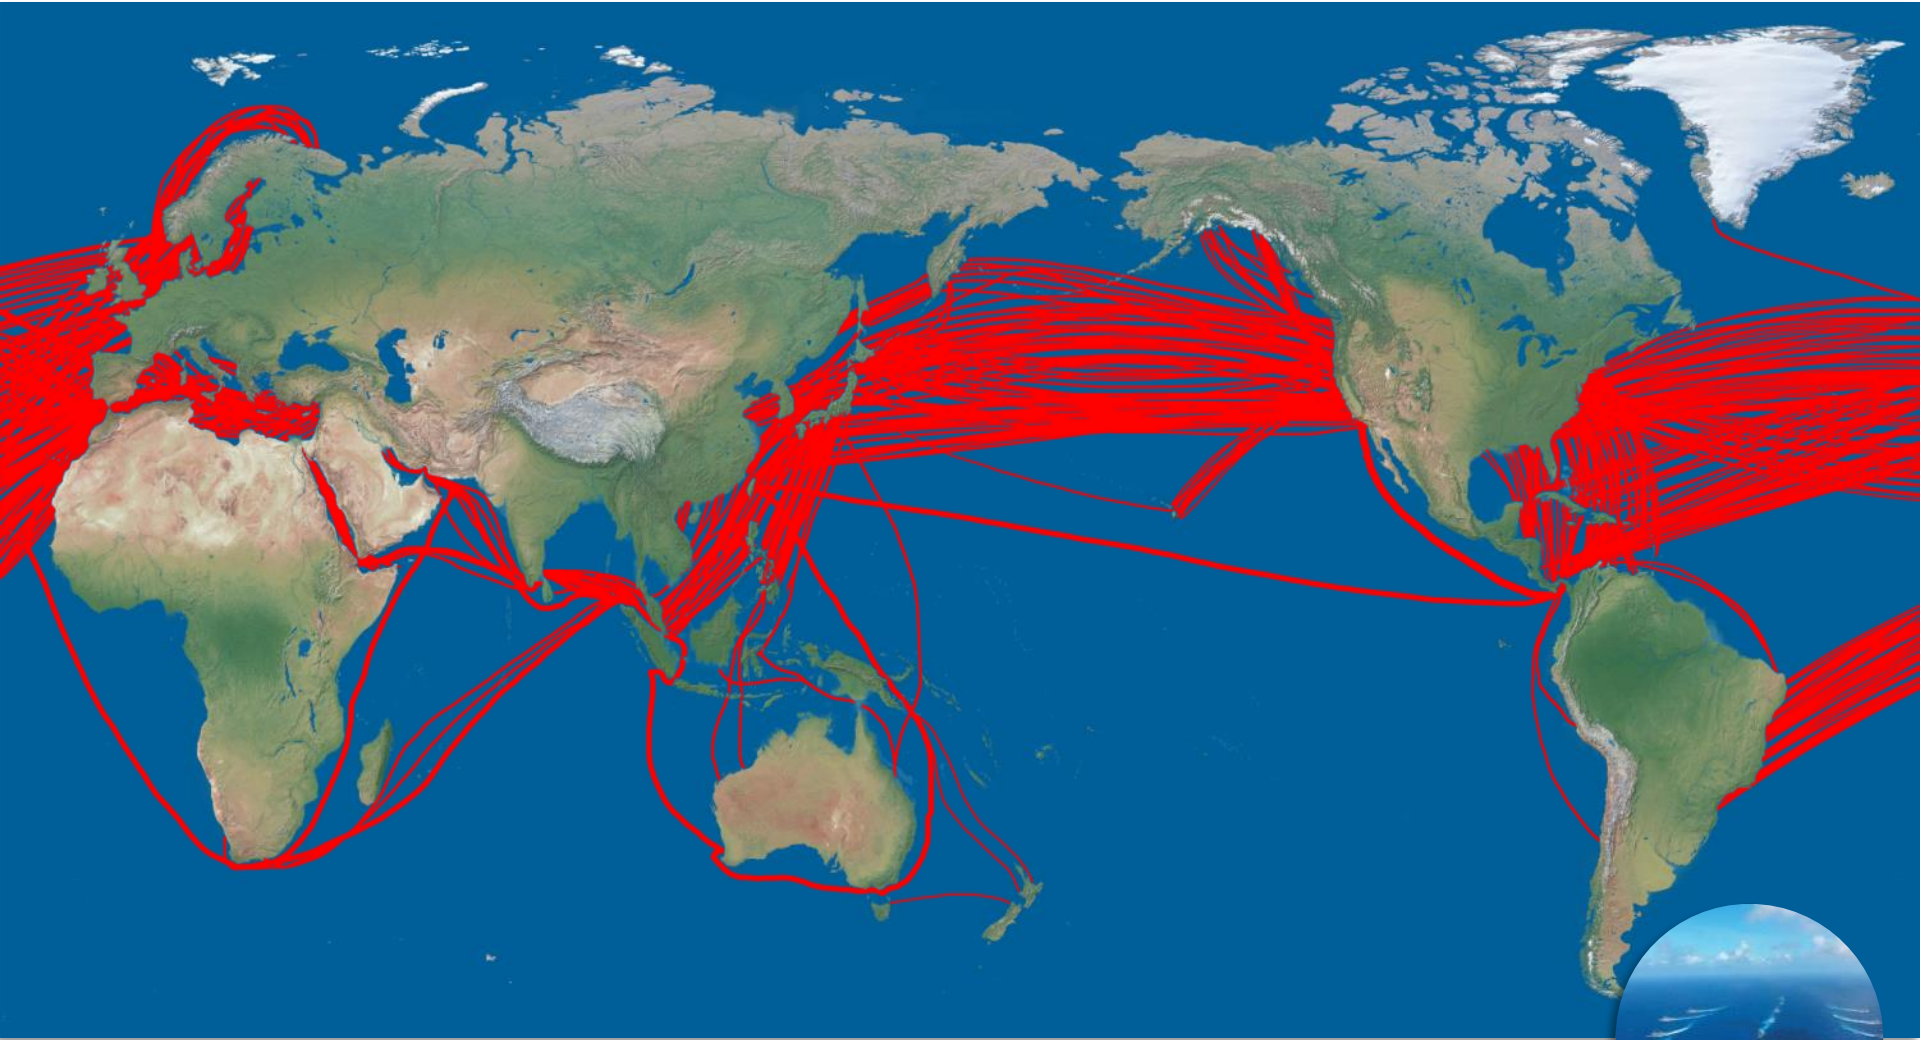

Framing the Challenge

Sea Lanes Remain the Lifeblood of Our Economy

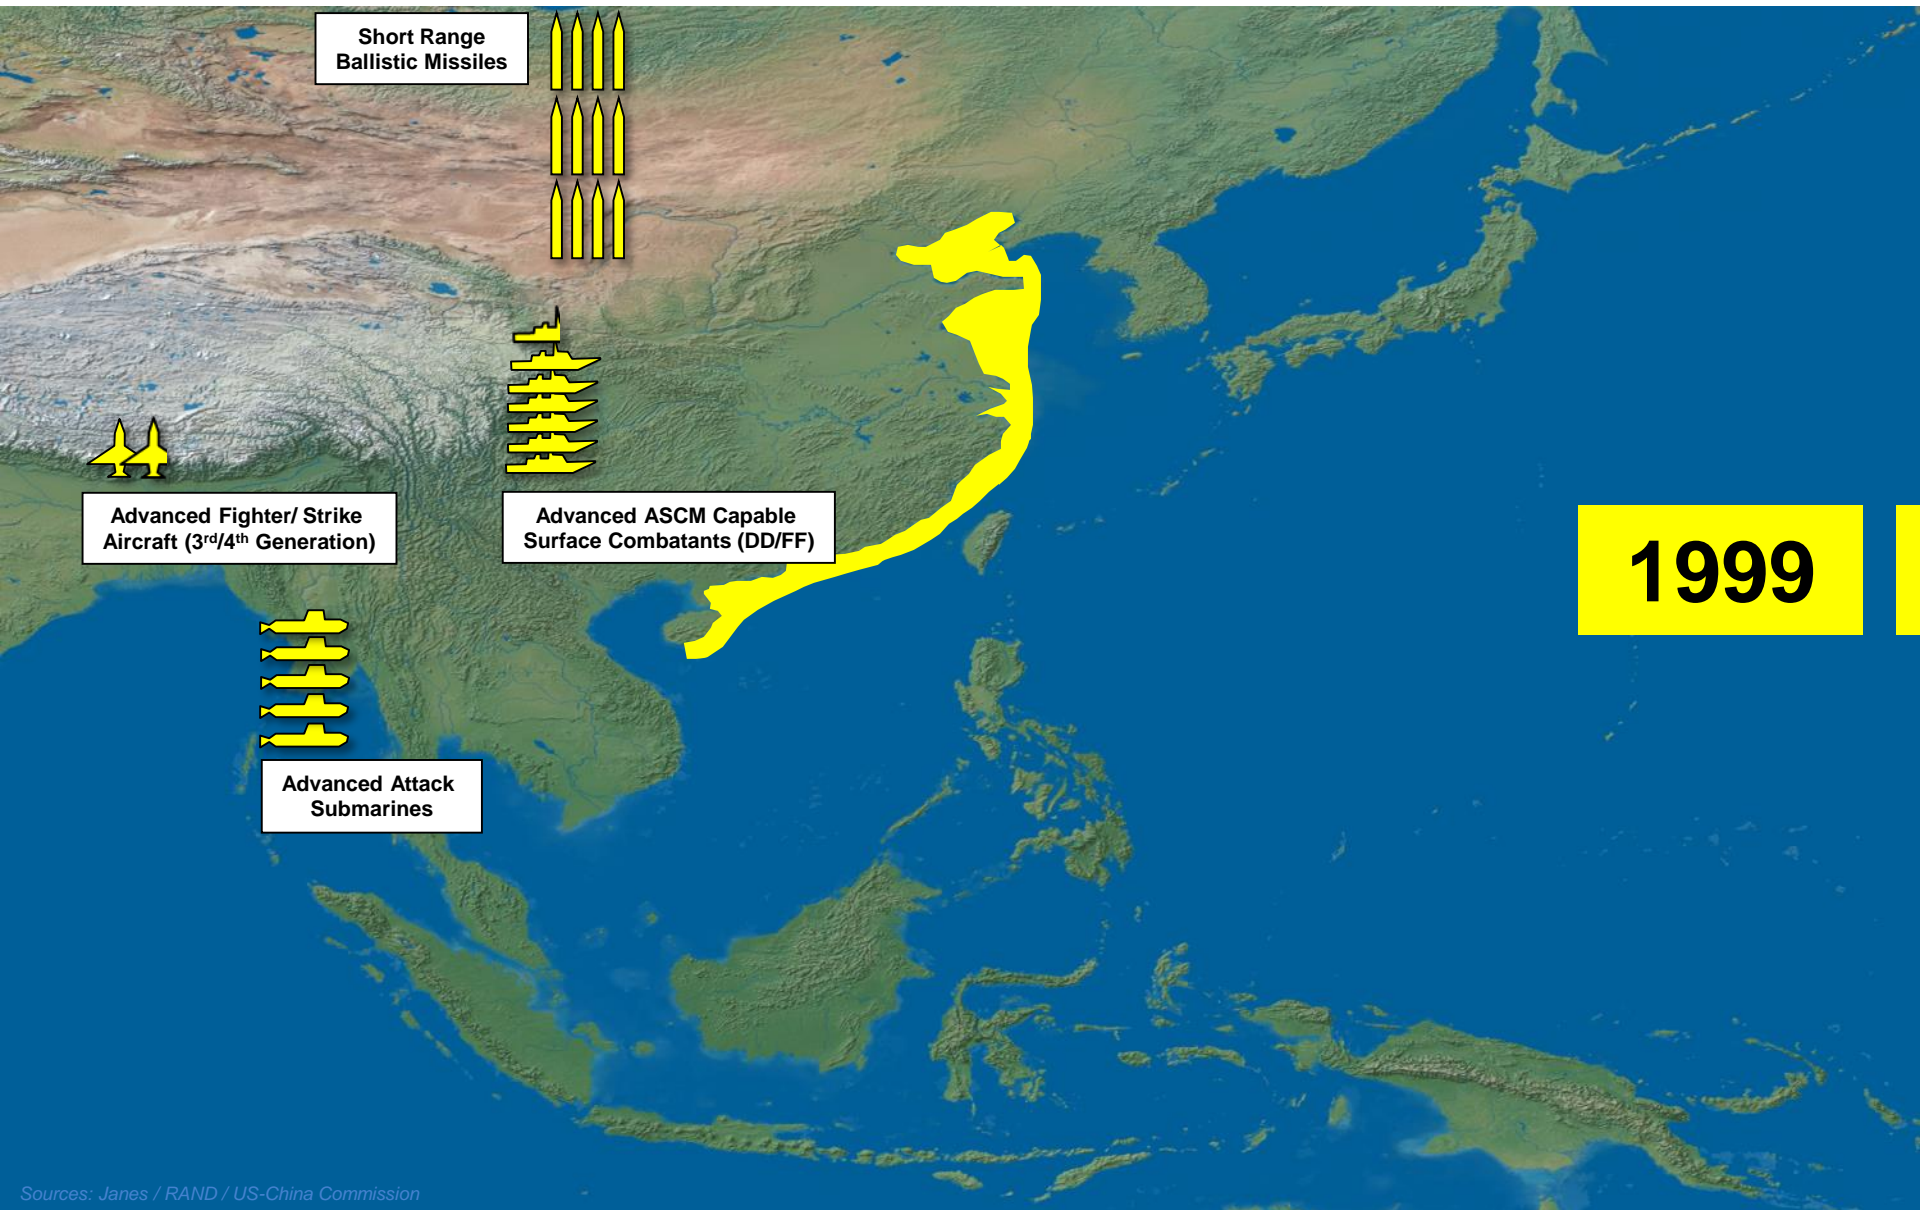

90% of global trade by **volume** / 70% of global trade by **value**
98% of telecoms traffic

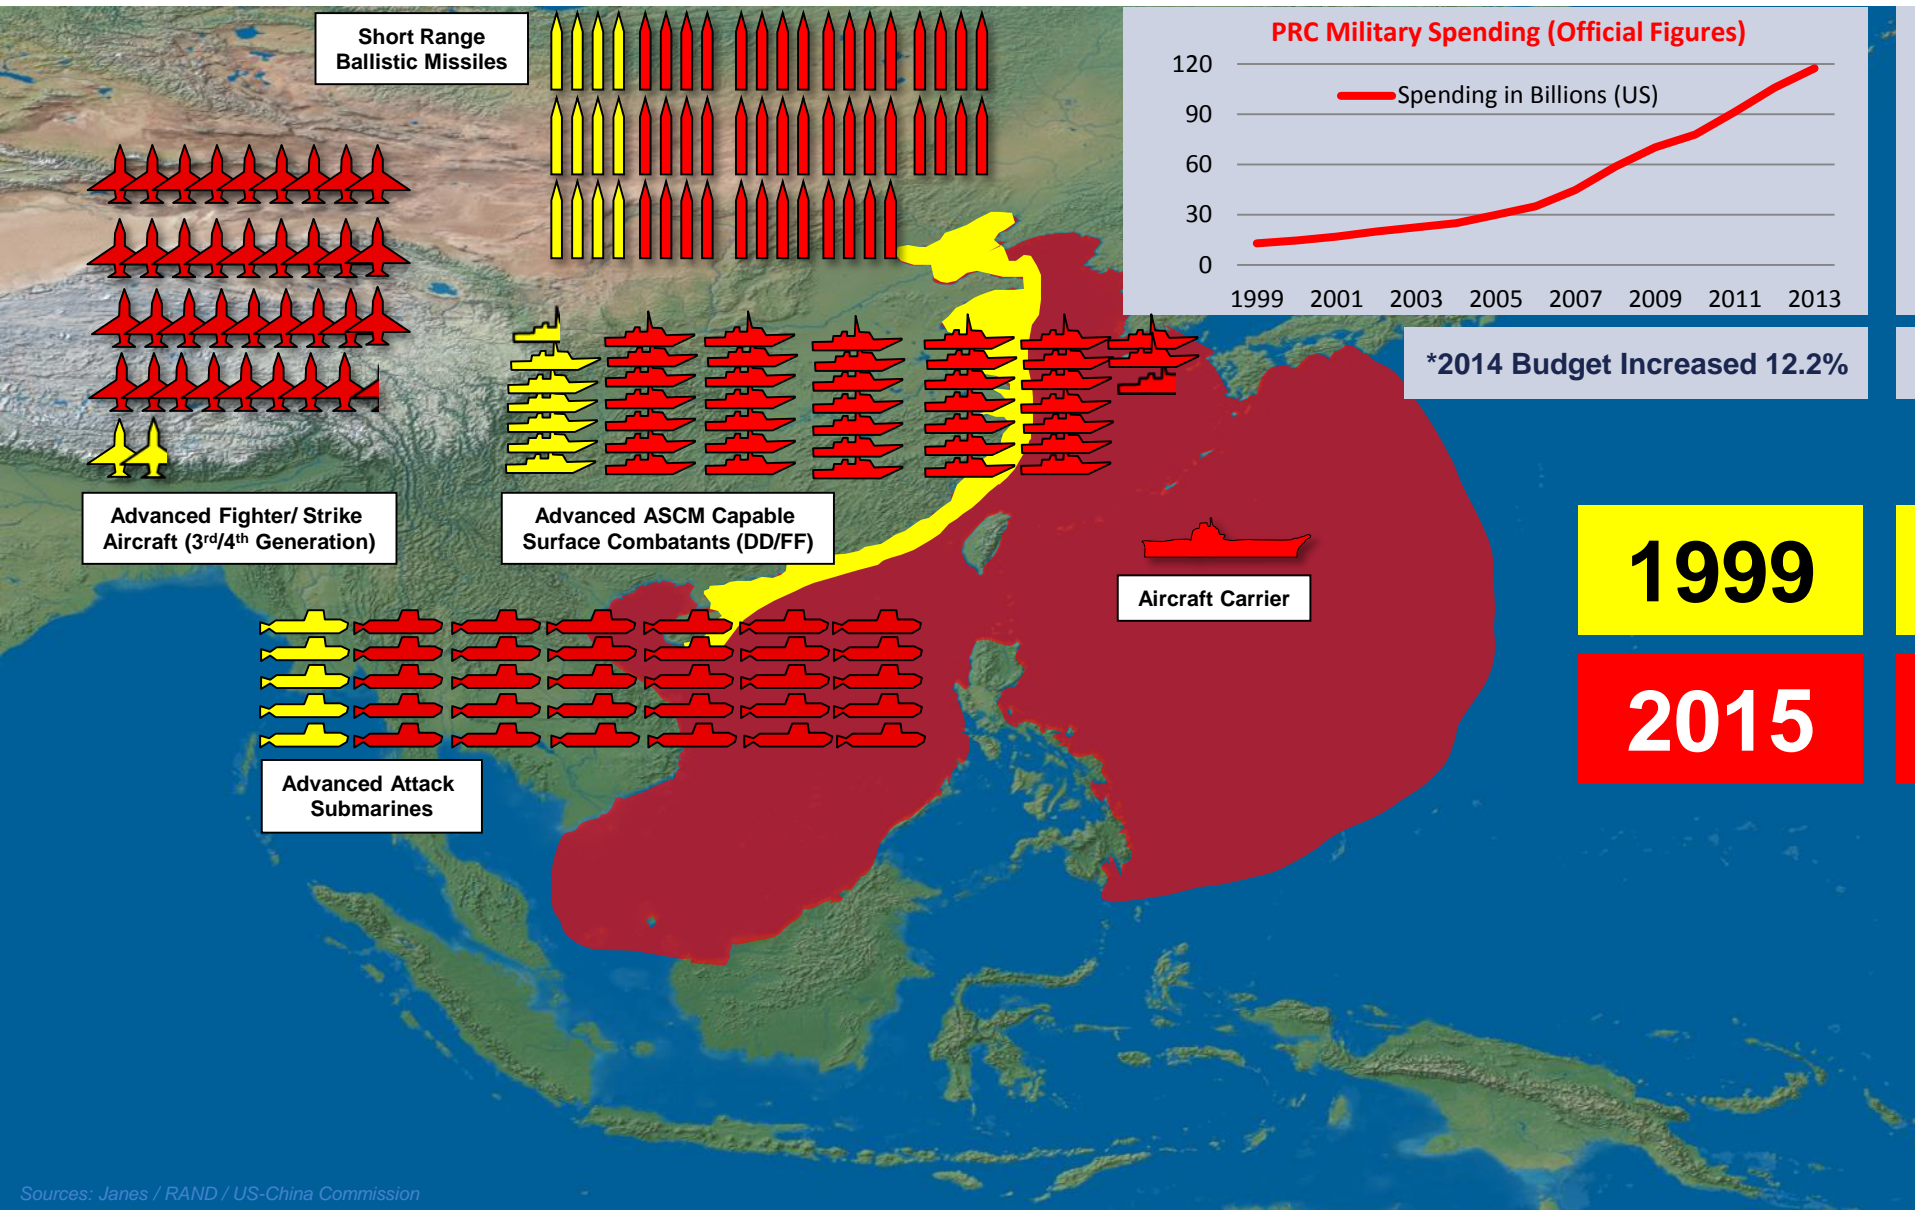

Changing Environment

1999

Changing Environment

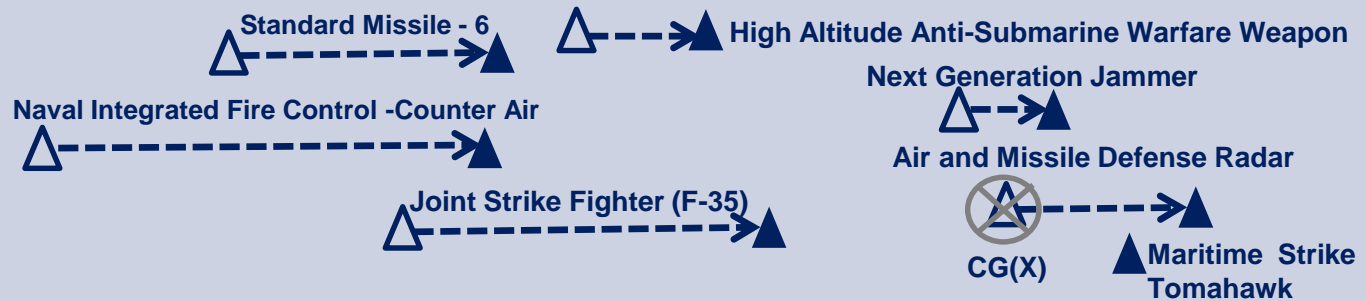

USN and PLA(N) Capability Fielding Trends

We're Slower!

USN Warfighting Advantage has Steadily Eroded

NAVAIR Response

Commander's Intent – *Remains Unchanged*

- Increase Speed of New Capabilities to Fleet
- Increase Readiness

Strategic Initiatives – *Focus on Speed*

- Capabilities Based Acquisition – *Rapid delivery of integrated capabilities*
- Sustainment Vision 2020 – *Predictive, integrated sustainment operations*
- Digital Business Operations – *Integrated business systems “apps” at the desktop*

Accelerating delivery of fully integrated capabilities which are designed, developed, and sustained in a **Model Based Digital Environment**

Why Are We Here Today?

- **REALLY** want / need your input
- NAVAIR cannot successfully do this without all of you(+)
- Success will drive / require a different relationship between gov't and industry
 - Business “arrangements” will change . . . will require true partnerships . . .

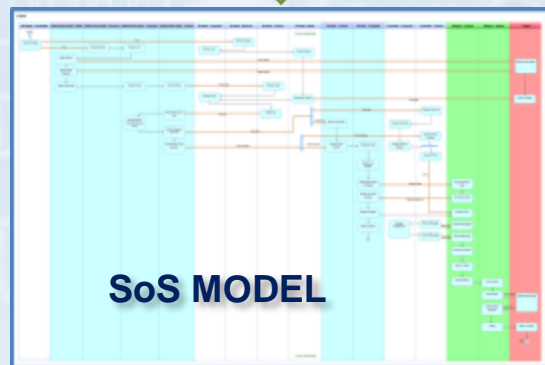

Our biggest challenges will not be technology and tools, they will be cultural and business related

SE Transformation - “*Shaping our Future...*”

Integrated Warfare Analysis establishes CONEMPS and Effects-Chains

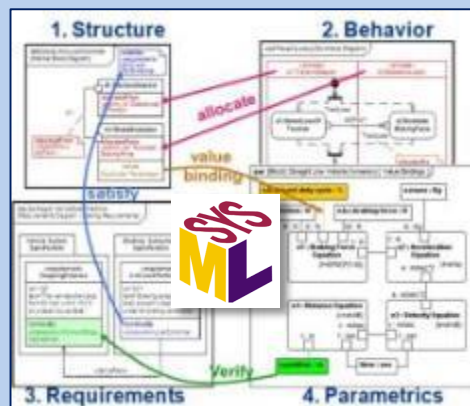

CONEMPS and Effects Chains are modeled at the System of Systems (SoS) level

Digital Linkage

**System models form
“Constructive” basis for LVC
M&S environment**

SYSTEM MODEL

Systems are developed in a Model-Based environment (SE Transformation)

Enabling Capabilities-Based T&E

Constructive

Virtual

Live

LVC-based training maximizes Fleet proficiency

Industry-Government Partnership

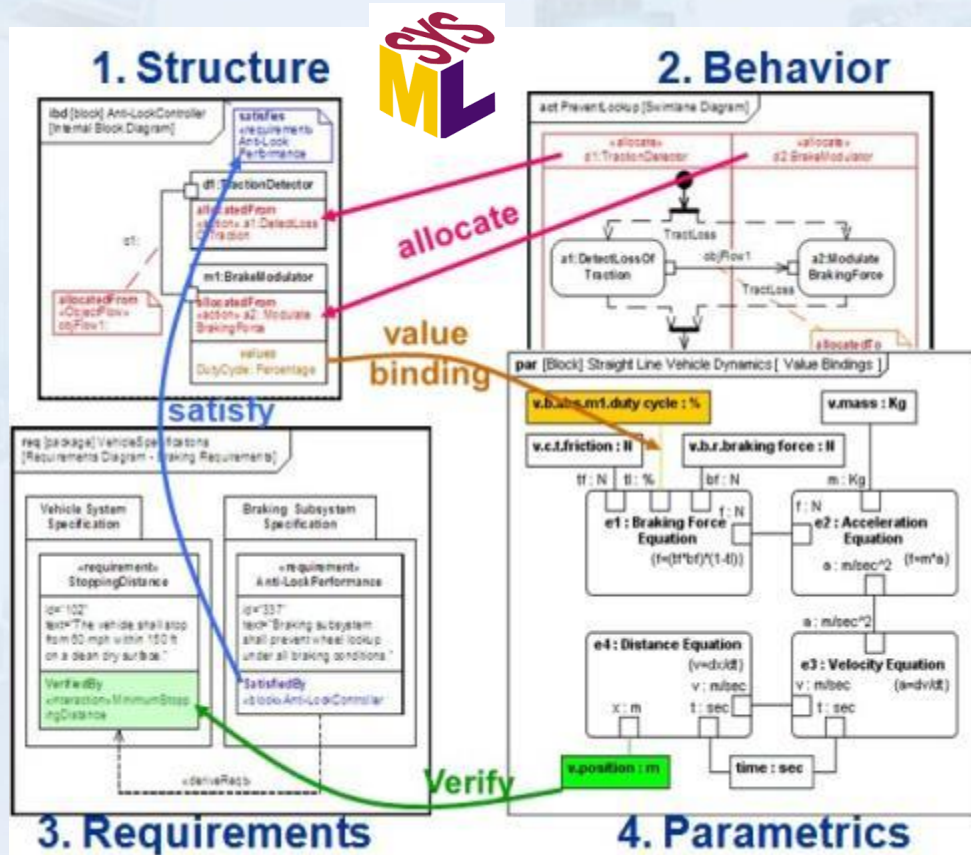

- SET applies to Government and Industry
 - Commercial cycle time is a function of development and production activities
 - DoD cycle times add the activities associated with Government oversight responsibilities
 - Both must be addressed to achieve the necessary reduction
- **Government** must reassess its role in the acquisition process and the methods for executing that role
 1. Criteria for gov't involvement/oversight (not every decision)
 2. If involved, must be on developer's timeline
 3. Must bring value to the decision – not just positional authority
- **Industry** must fully leverage advances in HPC-enabled models and participate in establishing a collaborative, integrated digital environment which enables continuous interaction

The Elements of SE Transformation

System Specification as a Model

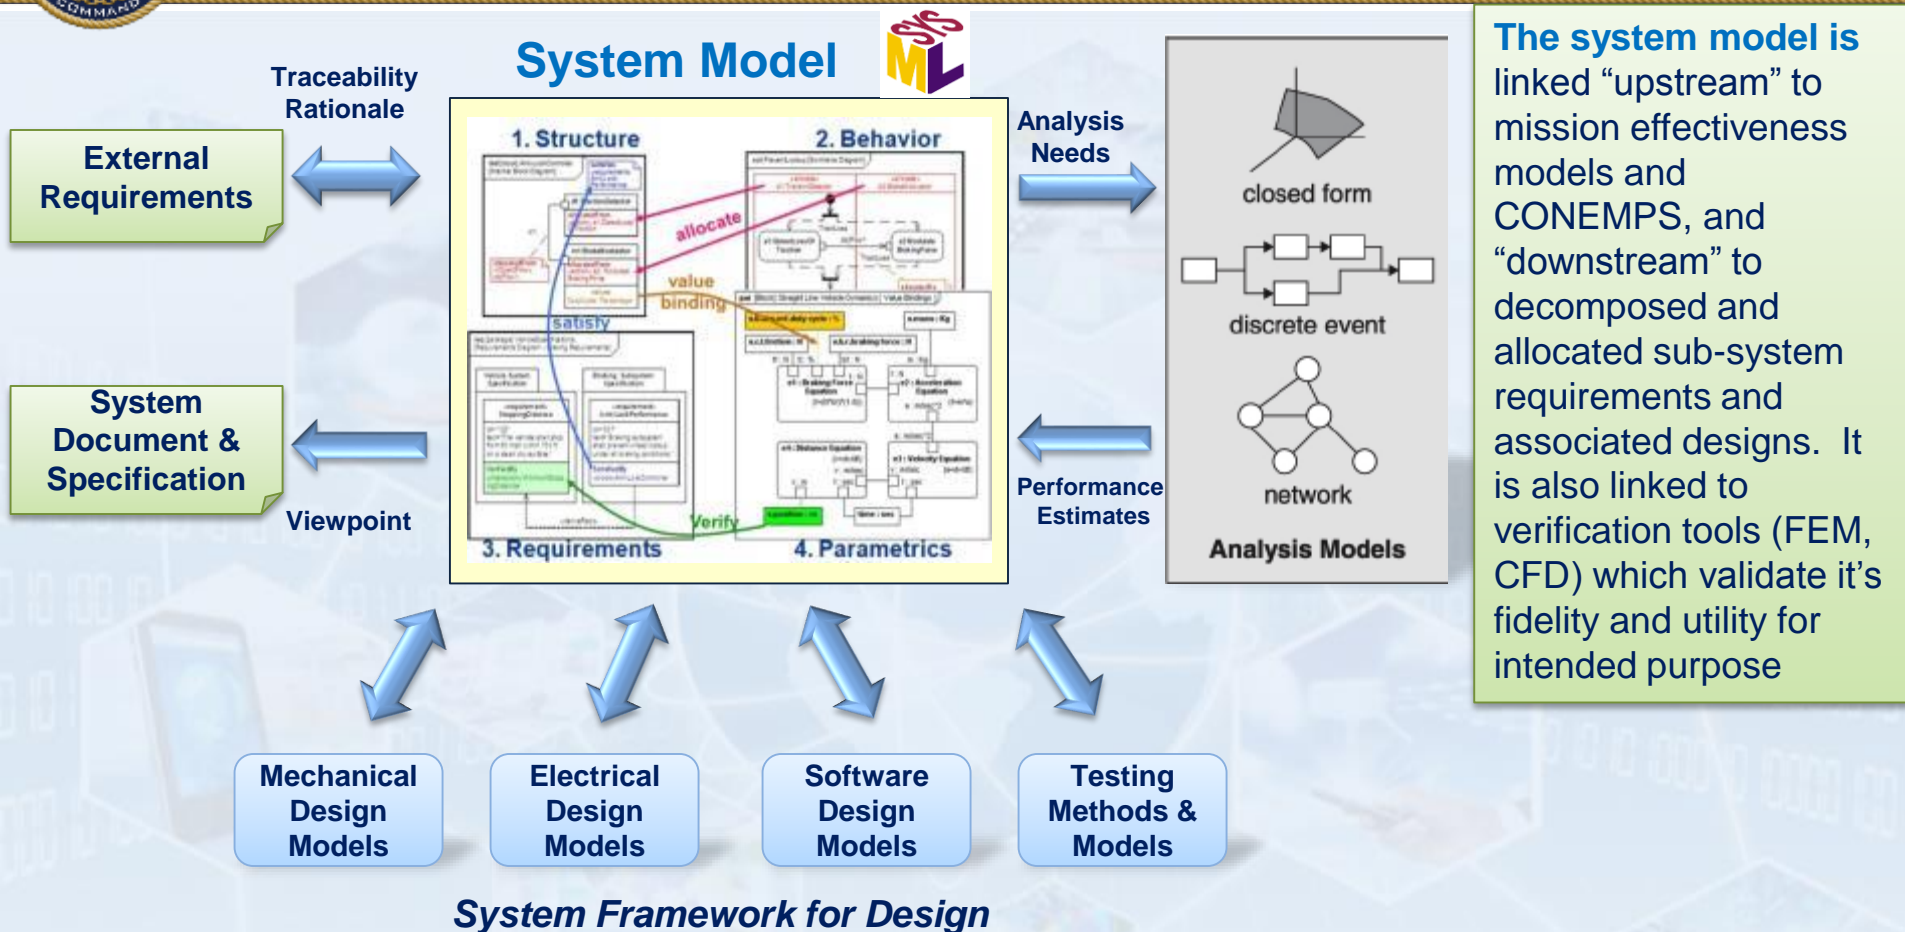

A **system model** is an interconnected set of model elements that represent key system aspects including structure, behavior, requirements, and parametrics

In **SET**, the System Spec (Performance Spec) would be instantiated in a model (using SysML). It will be developed in a collaborative workspace by a cross-functional team. The model will then be placed on the development contract vice a paper spec

System Model – As An Integration Framework

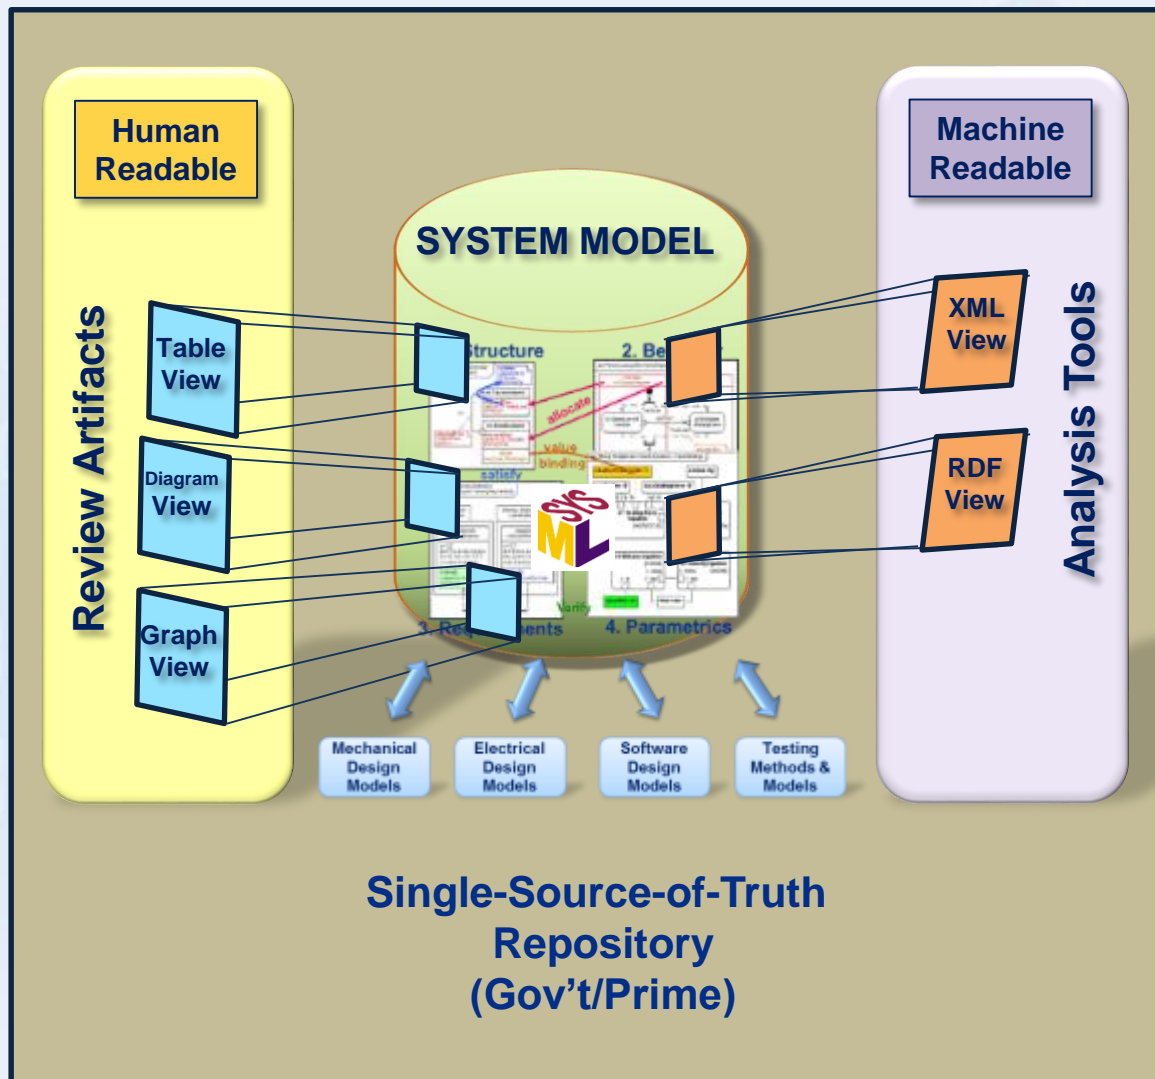

The system model is linked “upstream” to mission effectiveness models and CONEMPS, and “downstream” to decomposed and allocated sub-system requirements and associated designs. It is also linked to verification tools (FEM, CFD) which validate its fidelity and utility for intended purpose

The system model flows down, and is interconnected with the subsystem requirements and emerging designs. These design are instantiated in different models based on their governing physics (stress/strain, fluids, electro-magnetic, etc.)

Single Source of Truth

The entire set of models and tools is held in a single repository and becomes the Single-Source-of-Truth for the duration of system development

- Ability to *interrogate the design information* and extract data into the format necessary for the given task
 - Leverages *formalism*
 - Transformation rules are *reusable*
 - Provides *machine and human readable formats*
- Leverage the model by reviewing *the model itself*
- Stakeholders *focus on the views of the system model* that address their concerns

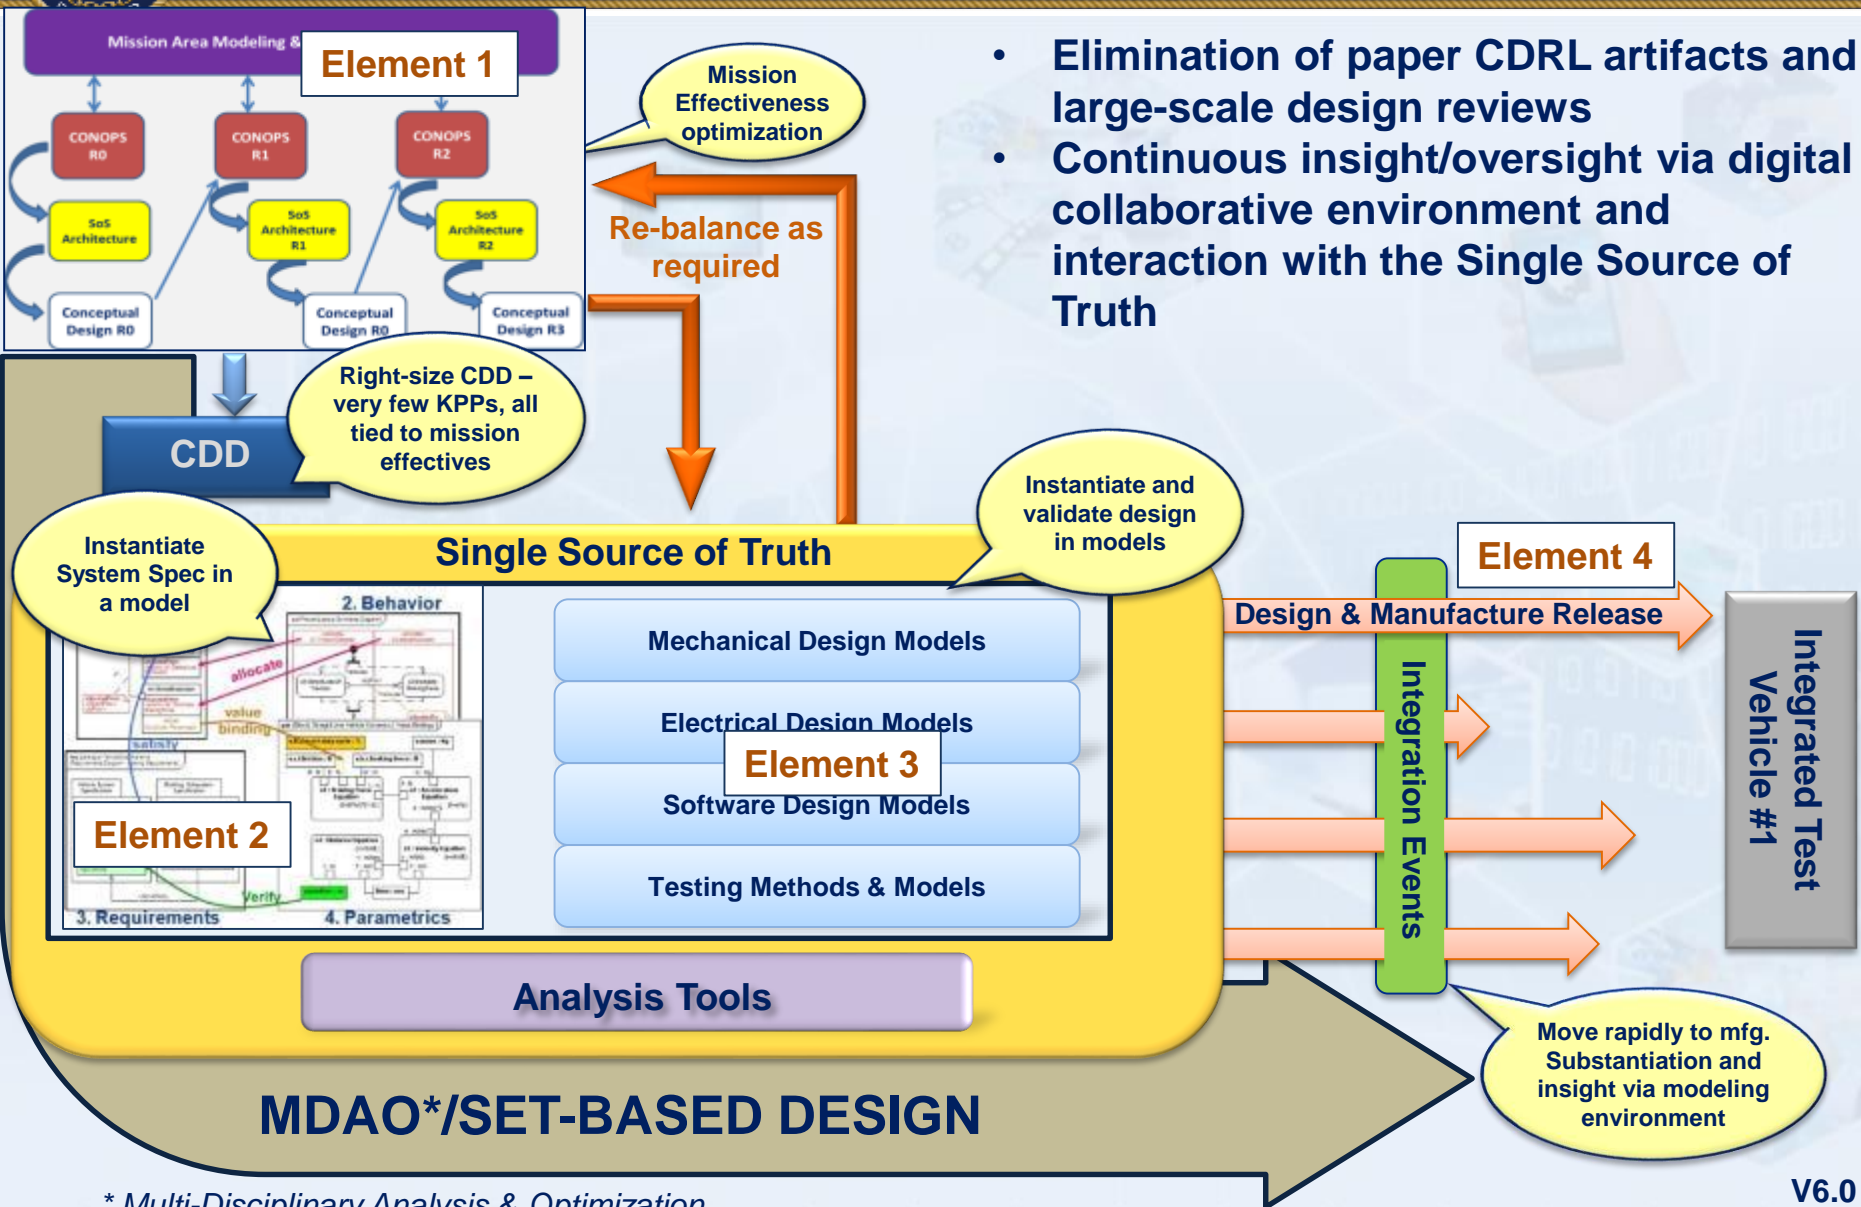

Putting It Together in a New Framework

SET Framework

4 Elements

V6.0

How SET Can Reduce Development Cycle Time

1. Right-size CDD

- Narrow top of the requirements pyramid
- Off-load requirements to other elements of SoS and via TTPs (CONOPS)
- KPPs must be tied to mission effectiveness, Ao or Cost

2. Eliminate or reduce SETR events

3. Eliminate/reduce CDRLs

4. MDAO enabled by HPC and multi-physics computational tools allows rapid optimization and design trades

5. Quality improvement at all levels – reduced rework due to requirements and design defects

6. Continual use of mission effectiveness modeling in design trade – reduce technical churn going after 100% compliance when 80% will satisfy mission

7. Allow asynchronous design and manufacture release decisions – Gov't involved real-time via IDE in production release decisions

8. Early T&E focused on model validation – allow models to do heavy lifting

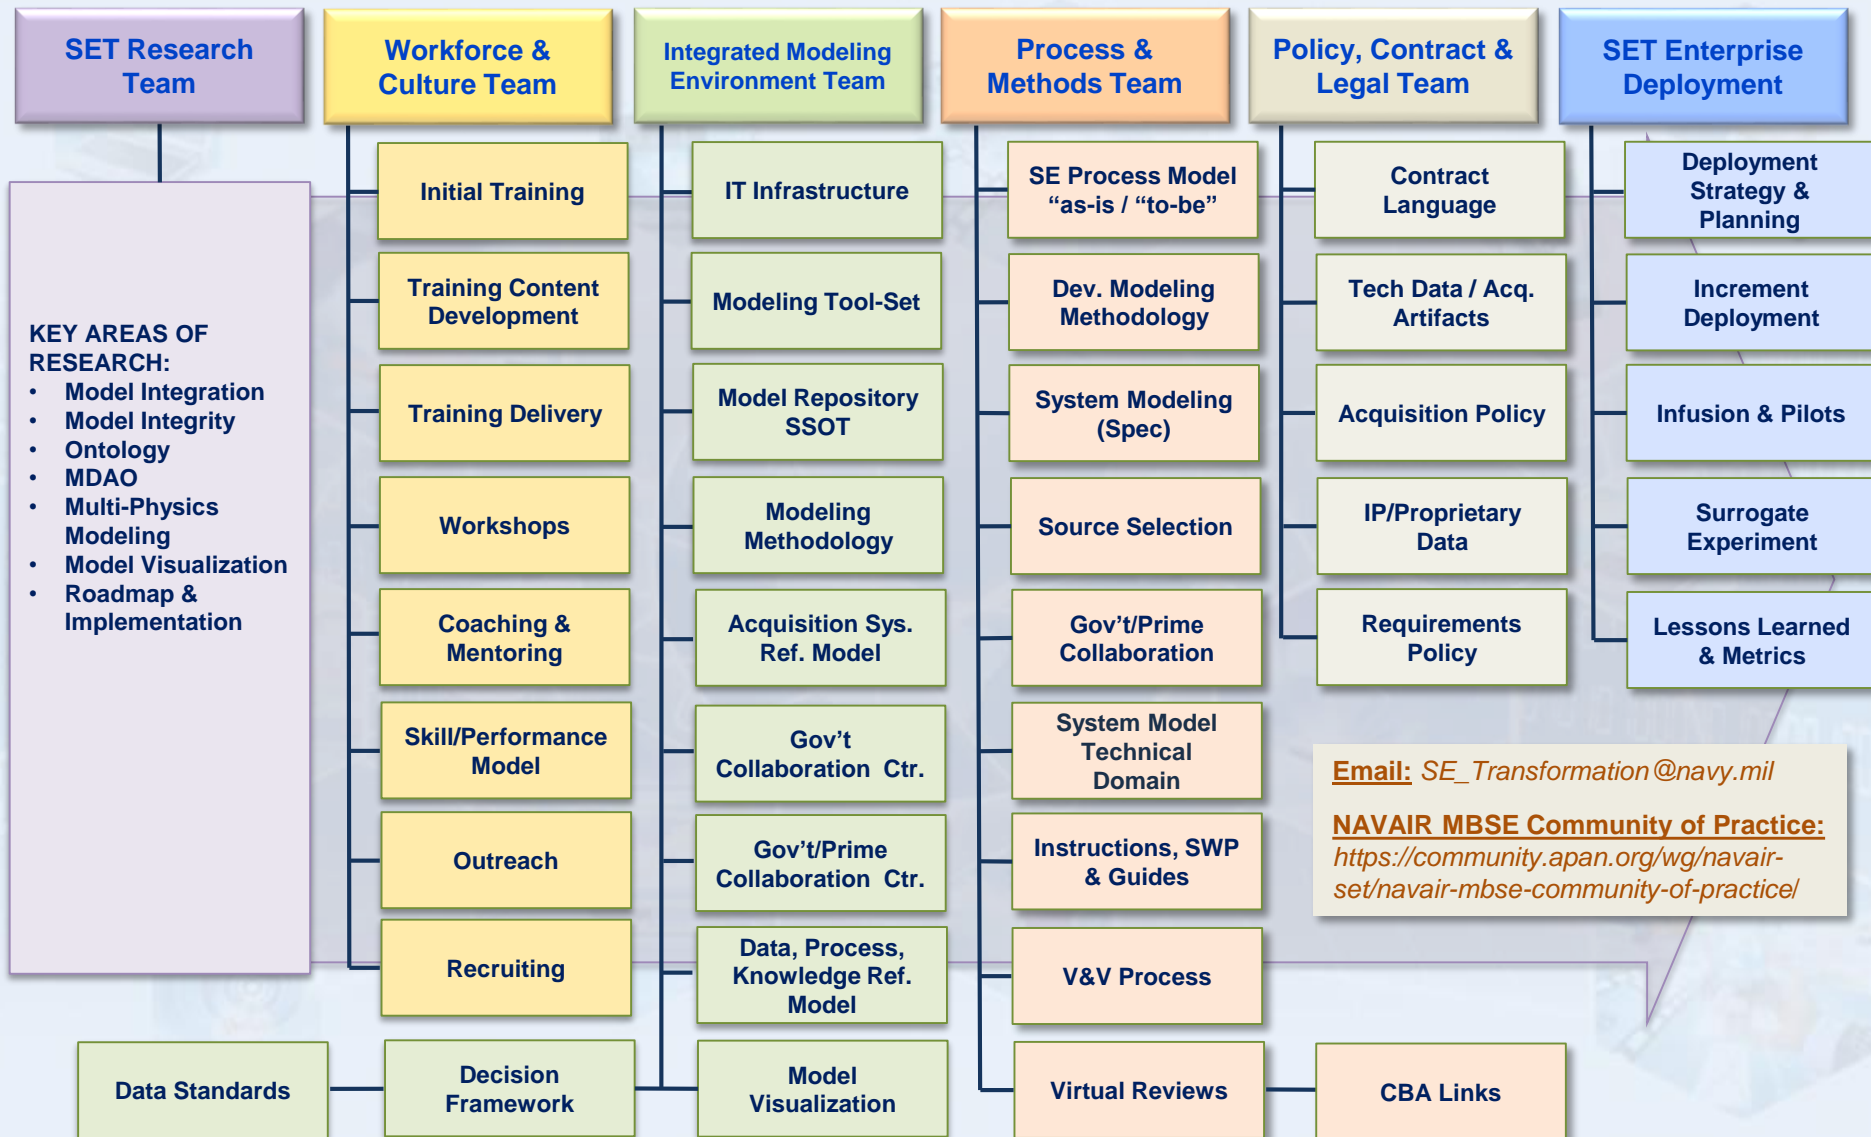

How NAVAIR is Executing SET

SET Framework

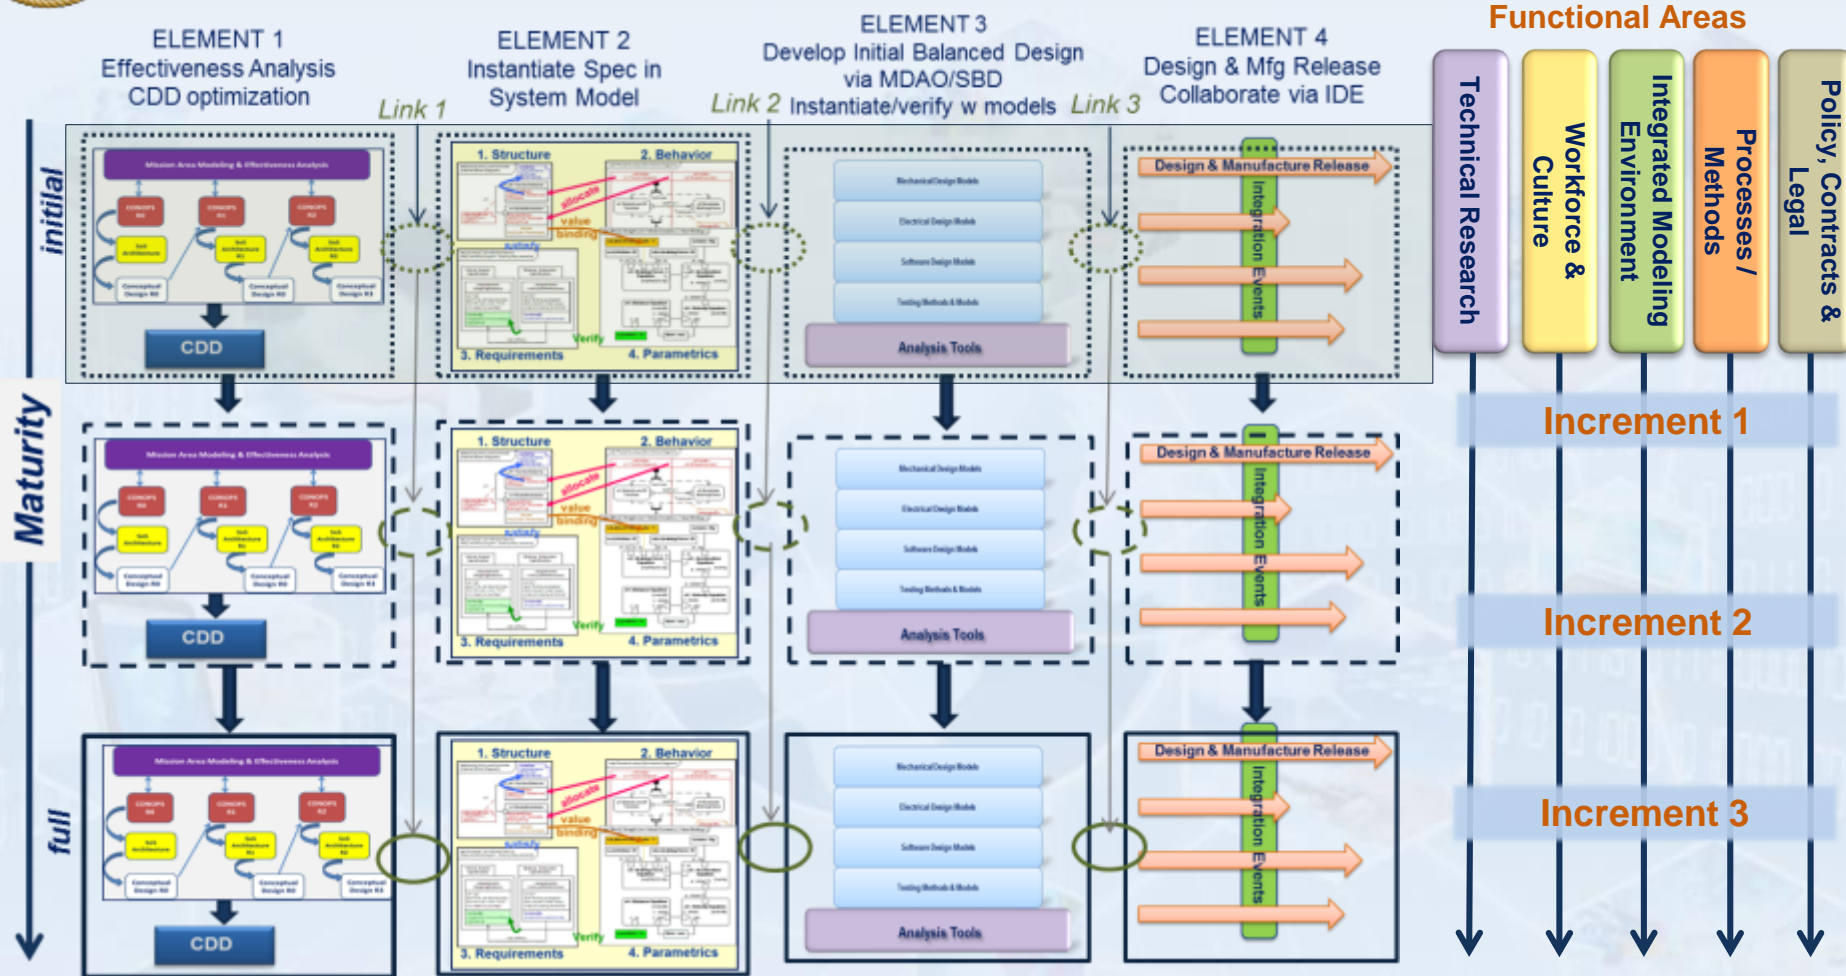

5 Functional Areas

V11.3

Execution Framework

Each Element requires work in the 5 Functional Areas in order to reach “Full Maturity”
